Section 1. INTRODUCTION

Section 1.1 Motor Characteristics

The level of sophistication in the controllability of traction motors has changed greatly over the past several years. Vehicle manufacturers and users are continuing to expect more value and flexibility in electric vehicle motor and control systems as they are applied today. In order to respond to these market demands, traction system designers have been forced to develop new approaches to reduce cost and improve functions and features of the overall system. Development is being done in a multi-generational format that allows the market to take advantage of today’s technology, while looking forward to new advances on the horizon. GE has introduced a second generation system using separately excited DC shunt wound motors. The separately excited DC motor system offers many of the features that are generally found on the advanced AC systems. Historically, most electric vehicles have relied have on series motor designs because of their ability to produce very high levels of torque at low speeds. But, as the demand for high efficiency systems increases, i.e., systems that are more closely applied to customers’ specific torque requirements, shunt motors are now often being considered over series motors. In most applications, by independently controlling the field and armature currents in the separately excited motor, the best attributes of both the series and the shunt wound motors can be combined.

As shown in from the typical performance curves of Figure 1, the high torque at low speed characteristic of the series motor is evident.

In a shunt motor, the field is connected directly across the voltage source and is therefore independent of variations in load and armature current. If field strength is held constant, the torque developed will vary directly with the armature current. If the mechanical load on the motor increases, the motor slows down, reducing the back EMF (which depends on the speed, as well as the constant field strength). The reduced back EMF allows the armature current to increase, providing the greater torque needed to drive the increased mechanical load. If the mechanical load is decreased, the process reverses. The motor speed and the back EMF increase, while the armature current and the torque developed decrease. Thus, whenever the load changes, the speed changes also, until the motor is again in electrical balance.

In a shunt motor, the variation of speed from no load to normal full load on level ground is less than 10%. For this reason, shunt motors are considered to be constant speed motors (Figure 2).

In the separately excited motor, the motor is operated as a fixed field shunt motor in the normal running range. However, when additional torque is required, for example, to climb non-level terrain, such as ramps and the like, the field current is increased to provide the higher level of torque. In most cases, the armature to field ampere turn ratio can be very similar to that of a comparable size series motor (Figure 3.)

Aside from the constant horsepower characteristics described above, there are many other features that provide increased performance and lower cost. The
following description provides a brief introduction to examples of some of these features.

Section 1.2 Solid-State Reversing

The direction of armature rotation on a shunt motor is determined by the direction in which current flows through the field windings. Because the shunt motor field only typically requires about 10% of the armature current at full torque, it is normally cost effective to replace the double-pole, double-throw reversing contactor with a low power transistor H-Bridge circuit (Figure 4).

By energizing the transistors in pairs, current can be made to flow in either direction in the field. The armature control circuit typically operates at 12KHZ to 15KHZ, a frequency range normally above human hearing. This high frequency coupled with the elimination of directional contactors, provides very quiet vehicle operation. The field control circuits typically operate at 2 KHZ.

The line contactor is normally the only contactor required for the shunt motor traction circuit. This contactor is used for both pre-charge of the line capacitors and for emergency shut down of the motor circuit, in case of problems that would cause a full motor torque condition. The line can be energized and de-energized by the various logic combinations of the vehicle, i.e. activate on key, seat or start switch closure, and de-energize on time out of idle vehicle. Again, these options add to the quiet operation of the vehicle.

Section 1.3 Flexible System Application

Because the shunt motor controller has the ability to control both the armature and field circuits independently, the system can normally be adjusted for maximum system efficiencies at certain operating parameters. Generally speaking, with the ability of independent field and armature, the motor performance curve can be maximized through proper control application.

Section 1.4 More Features with Fewer Components

Field weakening with a series wound motor is accomplished by placing a resistor in parallel with the field winding of the motor. Bypassing some of the current flowing in the field into the resistor causes the field current to be less, or weakened. With the field weakened, the motor speed will increase, giving the effect of “overdrive”. To change the “overdrive speed”, it is necessary to change the resistor value. In a separately excited motor, independent control of the field current provides for infinite adjustments of “overdrive” levels, between motor base speed and maximum weak field. The desirability of this feature is enhanced by the elimination of the contactor and resistor required for field weakening with a series motor.

With a separately excited motor, overhauling speed limit, or downhill speed, will also be more constant. By its nature, the shunt motor will try to maintain a constant speed downhill. This characteristic can be enhanced by increasing the field strength with the control. Overhauling load control works in just the opposite way of field weakening, armature rotation slows with the increase of current in the field.

Regenerative braking (braking energy returned to the battery) may be accomplished completely with solid-state technology. The main advantage of regenerative braking is increased motor life. Motor current is reduced by 50% or more during braking while maintaining the same braking torque as electrical braking with a diode clamp around the armature. The lower current translates into longer brush life and reduced motor heating. Solid state regenerative braking also eliminates a power diode, current sensor and contactor from the circuit.

For GE, the future is now as we make available a new generation of electric traction motor systems for electric vehicles having separately excited DC shunt motors and controls. Features that were once thought to be only available on future AC or brushless DC technology vehicles systems are now achievable and affordable.
Section 2. FEATURES OF SX FAMILY OF TRANSISTOR MOTOR CONTROLLERS

Section 2.1 Performance

Section 2.1.1 Oscillator Card Features

Section 2.1.1.a Standard Operation

With the accelerator at maximum ohms or volts, the creep speed can be adjusted by Function 2 of the Handset or a trimpot. The field control section allows the adjustment of the field weakening level in order to set the top speed of the motor. This top speed function (Minimum Field Current) is enabled when the armature current is less than the value set by Function 24 and the accelerator pedal is fully depressed. Top Speed can be adjusted by Function 7 of the Handset or a trimpot. The percent on-time has a range of approximately 0 to 100 percent. The SX controllers operate at a constant frequency and the percent on-time is controlled by the pulse width of the voltage / current applied to the motor circuits.

Section 2.1.1.b Creep Speed

With the accelerator at maximum ohms or volts, the creep speed can be adjusted by Function 2 of the Handset. At creep speed, the ON time can decrease to approximately 5%, with the OFF time at approximately 95%. At full transistor operation, this condition will be reversed (short OFF time, long ON time). This variation of ON and OFF time of the oscillator varies the voltage applied to the motor, thereby varying the speed of the motor for a given load.

Section 2.1.1.c Control Acceleration

This feature allows for adjustment of the rate of time it takes for the control to accelerate to 100% applied battery voltage to the motor on hard acceleration. Armature C/A is adjusted by Function 3 from 0.1 to 22 seconds.

Section 2.1.2 Current Limit

This circuit monitors motor current by utilizing sensors in series with the armature and field windings. The information detected by the sensor is fed back to the card so that current may be limited to a pre-set value. If heavy load currents are detected, this circuit overrides the oscillator and limits the average current to a value set by Function 4 and Function 8 of the Handset. The C/L setting is based on the maximum thermal rating of the control. Because of the flyback current through Q2, the motor current is usually greater than battery current, except at 100% ON time.

Section 2.1.3 Braking

Section 2.1.3.a Regenerative Braking to Zero Speed

Slow down is accomplished when reversing direction by providing a small amount of retarding torque for deceleration. If the vehicle is moving, and the directional lever is moved from one direction to the other, the regen signal is initiated. Once the regen signal has been initiated, the field current is increased (armature circuit shown in Figure 5). Armature current is regulated to the regen current limit as set by Function 9. As the vehicle slows down, the field current continues to increase, and transistor Q2 begins to chop. The field current will increase until it reaches a preset value set by Function 10, and transistor Q2 on-time will increase until it reaches 100% on-time. Once both of the above conditions have been met, and regen current limit can no longer be maintained, the braking function is canceled. The fields will then reverse, and the control reverts back to motoring. Part of the energy produced by the motor during regen is returned to the battery, and part is dumped in the motor as heat.

Section 2.1.3.b Pedal Position Regenerative Braking

This feature allows control of the stopping distance based on pedal position when there has been a "directional switch" change. Pedal position will reduce the regenerative current to the as the accelerator is returned to the creep speed position. Maximum regenerative current is obtained with the accelerator in the top speed position.

Section 2.1.3.c Auto Braking

This feature is enabled by initiating a "neutral position" using either the directional switch or the accelerator switch. Once activated, Auto Braking operates similar to Pedal Position Regenerative Braking and is adjusted by using Function 21 of the Handset.

Section 2.1.4 Auxiliary Speed Control

Section 2.1.4.a Field Weakening

This function allows the adjustment of the field weakening level in order to set the top speed of the motor. The function is enabled when the armature current is less than the value set by Function 24 and the accelerator pedal is fully depressed. It is important to note that this function is used to optimize motor and control performance, and this setting will be determined by GE and OEM engineers at the time of vehicle development. This setting must not be changed by field personnel, without the permission of the OEM.
Section 2.1.4.b Speed Limits

This feature provides a means to control speed by limiting motor volts utilizing three adjustable speed limits. This motor volt limit regulates top speed of the transistor controller, but actual truck speed will vary at any set point depending on the loading of the vehicle. Each speed limit can be adjustable with the Handset using Functions 11, 12, and 13.

Section 2.1.5 Ramp Operation

Section 2.1.5a Ramp Start

This feature provides maximum control torque to restart a vehicle on an incline. The memory for this function is the directional switch. When stopping on an incline, the directional switch must be left in its original or neutral position to allow the control to initiate full power when restarted. The accelerator potentiometer input will modulate ramp start current.

Section 2.1.5b Anti-Rollback

This feature provides retarding torque to limit rollback speed in the non-travel direction when the ACC pedal is released when stopping on a grade, or when the brake pedal is released when starting on a grade. This feature forces the vehicle to roll very slowly down the grade when accelerator or brake is released. Because the vehicle can gain significant speed during roll-back, the torque needed to re-start on the ramp is lower than an unrestricted roll-back speed.

Section 2.1.6 Steer Pump Contactor Time Delay

This feature provides two options for SP time delay. Option 1 provides a 0.5 to 63 second time delayed drop out of the steer pump contactor when the Forward or Reverse directional switch is opened. This Option 1 is overridden by a 1.5 second time delayed drop out whenever the seat switch is opened. Option 2 provides a 0.5 to 63 second time delayed drop out of the SP contactor when the seat switch is opened.

Section 2.1.7 On-Board Coil Drivers & Internal Coil Suppression

Coil drivers for the LINE and SP contactors are on-board the control card. These contactors must have coils rated for the vehicle battery volts.

Section 2.2 System Protective Override

Section 2.2.1 Static Return to Off (SRO)

This inherent feature of the control is designed to require the driver to return the directional lever to the neutral position anytime he leaves the vehicle and returns. Additionally, if the seat switch or key switch is opened, the control shuts off and cannot be restarted until the directional lever is returned to neutral. A time delay of approximately 2 seconds is built into the seat switch input to allow momentary opening of the seat switch, if a bump is encountered.

Section 2.2.2 Accelerator Volts Hold Off

This feature checks the voltage level at the accelerator input whenever the key switch or seat switch is activated. If, at start up, the accelerator is calling for more than 20% of full speed, the control will not operate. This feature assures that the control is calling for low speed operation at start up.

Section 2.2.3 Pulse Monitor Trip (PMT)

The PMT design contains three features which shut down, or lock out, control operation if a fault conditions occurs that would cause a disruption of normal vehicle operation:

- Look ahead
- Look again
- Automatic look again and reset

The PMT circuit will not allow the control to start under the following conditions:

- The control monitors both armature and field FET’s at start-up and during running.
- The control will not allow the line contactor to close at start-up, or will drop it out during running, if either the armature or field FET’s are defective, so as to cause uncontrolled truck movement.

Section 2.2.4 Thermal Protector (TP)

This temperature sensitive device is mounted to the heat sink of the power transistor (Q1). If the transistor’s temperature begins to exceed the design limits, the thermal protector will lower the maximum current limit, and maintain the transistors within their temperature limits. Even at a reduced current limit, the vehicle will normally be able to reach sufficient speed. As the control cools, the thermal protector will automatically reset, returning the control to full power.

Section 2.2.5 Low Voltage

Batteries under load, particularly if undersized or more than 80 percent discharged, will produce low voltages at the control terminals. The SX control is designed for use...
down to 50 percent of a nominal battery voltage of 36-84 volts, and 75 percent of a nominal battery voltage of 24 volts. Lower battery voltage may cause the control to operate improperly, however, the resulting PMT should open the Line contactor, in the event of a failure.

Section 2.3 Diagnostics

Section 2.3.1 Systems Diagnostics

The control detects the system’s present operating status and can be displayed to either the Dash Display or the Handset. There are currently over 70 status codes that are available with SX systems using Traction and Pump controls and Truck Management Module (TMM). Along with the status code display from the TMM, the SX control is capable of reducing the current to the motor, alerting the operator of a critical fault condition.

Section 2.3.2 Status Codes

Section 2.3.2a Standard Status Codes

The SX traction control has over 30 Status Codes that assist the service technician and operator in trouble shooting the vehicle. If mis-operation of the vehicle occurs, a status code will be displayed on the Dash Display for vehicles so equipped, or be available by plugging the Handset into the “y” plug of the logic card. With the status code number, follow the procedures outlined in DIAGNOSTIC STATUS CODES to determine the problem and a solution.

Note: The Status Code Instruction Sheets do not claim to cover all possible causes of a display of a “status code”. They do provide instructions for checking the most direct inputs that can cause status codes to appear.

Section 2.3.2b Stored Status Codes

This feature records the last 16 “Stored Status Codes” that have caused a PMT controller shut down and/or disrupted normal vehicle operation. (PMT type faults are reset by cycling the key switch). These status codes, along with the corresponding BDI and hourmeter readings, can be accessed with the Handset, or by using the RS 232 communications port and dumping the information to a Personal Computer terminal.

Section 2.3.3 Hourmeter Readings

This feature will display the recorded hours of use of the traction and pump control to the Dash Display each time the key switch is turned off.

Section 2.3.3a Maintenance Alert & Speed Limit

This feature is used to display Status Code 99 and/or activate a speed limit when the vehicle operating hours match the hours set into the maintenance alert register. This feature is set with the Handset using Functions 19 and 20. The operator is alerted that maintenance on the vehicle is required.

Section 2.3.4 Battery Discharge Indication (BDI)

The latest in microprocessor technology is used to provide accurate battery state of charge information and to supply passive and active warning signals to the vehicle operator. Features and functions:

- Displays 100 to 0 percent charge.
- Display blinks with 20% charge. Disables pump circuit with 10% charge. Auto ranging for 36/48 volt operation. Adjustable for use on 24 to 80 volts.

Section 2.3.4a Internal Resistance Compensation

This feature is used when the Battery Discharge Indicator is present. Adjustment of this function will improve the accuracy of the BDI.

Section 2.3.5 Handset

This is a multi-functional tool used with the LX, ZX, and SX Series GE solid state controls. The Handset consists of a Light Emitting Diode (LED) display and a keyboard for data entry. Note, for ordering purposes, a separate Handset part is required for SX controls.

Features and functions:

- Monitor existing system status codes for both traction and pump controls. Monitor intermittent random status codes.
- Monitor battery state of charge, if available.
- Monitor hourmeter reading on traction and pump controls. Monitor or adjust the control functions.

Section 2.3.6 RS 232 Communication Port

This serial communication port can be used with Interactive Custom Dash Displays to allow changes to vehicle operating parameters by the operator. Or, it can be used by service personnel to dump control operating information and settings into a personal computer program.

Section 2.3.6a Interactive Dash Display Modes

The Interactive Custom Dash Display allows the operator to select the best vehicle performance for changing factory (task) conditions. There are four (4) “operator interaction
modes” that can be selected by depressing a push button on the dash display.

From the Dash Display, the operator may select any of four pre-set interactive modes consisting of (4) Controlled Acceleration levels, (4) Auto Regen levels and (4) Speed Limits.
These interactive modes are “pre-set” using the Handset (Functions 48-63) or a personal computer (Functions 97-112). This feature allows the operator to select the best vehicle performance for changing factory (task) conditions.

Section 2.3.7 Circuit Board Coil Driver Modules

Coil drivers are internal to the control card, and are the power devices that operate the Line and SP contactor coils. On command from the control card, these drivers initiate opening and closing the contactor coils. All driver modules are equipped with reverse battery protection, such that, if the battery is connected incorrectly, the contactors can not be closed electrically.

Section 2.3.8 Truck Management Module (TMM)

The Truck Management Module is a multifunction accessory card, or an integral function of the GE Pump controls when used with the SX Traction control. The Module provides the OEM the ability to initiate status codes or operator warning codes to be displayed on the Dash Display, whenever a normally open switch or sensor wire provides a signal to the Module.

The TMM Module can be used to display a separate status code indicating over-temperature of traction motors, hydraulic motors, or any other device or system that can activate a switch that closes.

The TMM Module can also be used as a Brush Wear Indicator (BWI). The Brush Wear Indicator is designed to detect a “worn out brush” and display a fault code on the Dash Display to warn maintenance personnel that the motor brushes need to be replaced before they wear to the point of causing destructive damage to the motor commutator surface.

Section 2.4 Hydraulic Pump Control

This hydraulic motor controller consists of the following features:
- Four speeds, adjustable from 0 to 100% motor volts. Fixed speeds actuated by switch closure to negative.
- Current limit and controlled acceleration adjustable.
- Battery Discharge Indicator interrupt compatible.

Operation of voltage regulator card: This card provides the basic functions required for controlling the pump control, optional contactors, and PMT functions. Battery positive is applied through a main control fuse to the key switch, energizing the control card power supply input to P1.

When a pump contactor is used, PMT operation is the same as outlined for the traction controllers.

The four speed (motor volts) reference points P12, P19, P20 and P21 are selected by connecting these points independently to battery negative.

The first speed is obtained by closing Speed Limit I (P12) to control negative. SL1 is adjustable by Function 11 using the Handset to adjust motor voltage from 0 to 100%. The specified motor volts will be regulated, however, the magnitude of motor current will vary depending on the loading of the vehicle.

The second speed is obtained by closing SL2 (P19) to control negative. SL2 is adjusted using the Handset and Function 12, similar to SL1.

The third speed is obtained by closing SL3 (P20) to control negative. SL3 is adjusted using the Handset and Function 13, similar to SL1.

The fourth speed is obtained by closing SL4 (P21) to control negative. SL4 is adjusted using the Handset and Function 14, similar to SL1.

If more than one Speed Limit is activated, the selected speed with the highest motor volts will override the low motor volt speed. The current limit circuit is adjustable and operates the same as the traction current limit.

The controlled acceleration circuit is adjustable and operates the same as the traction circuit. Adjustment range is from 0.1 to 22.0 seconds.

The Battery Discharge Indicator (BDI) interrupt will disable the hydraulic controller if the connection at P10 loses the 12 volt signal from the traction control. BDI interrupt can be disabled by Function 17 using the Handset. Select card type with or without BDI function.

Section 4.1 General Maintenance Instructions

The transistor control, like all electrical apparatus, does have some thermal losses. The semiconductor junctions have finite temperature limits, above which these devices may be damaged. For these reasons, normal maintenance should guard against any action which will expose the components to excessive heat and/or those conditions which will reduce the heat dissipating ability of the control, such as restricting air flow.

The following Do’s and Don’t’s should be observed:

Any controls that will be applied in ambient temperatures over 100° F (40° C) should be brought to the attention of the vehicle manufacturer.

All external components having inductive coils must be filtered. Refer to vehicle manufacturer for specifications.

The wiring should not be directly steam cleaned. In dusty areas, blow low-pressure air over the control to remove dust. In oily or greasy areas, a mild solution of detergent or denatured alcohol can be used to wash the control, and then low-pressure air should be used to completely dry the control.

For the control to be most effective, it must be mounted against the frame of the vehicle. The metal vehicle frame, acting as an additional heat sink, will give improved vehicle performance by keeping the control package cooler. Apply a thin layer of heat-transfer grease (such as Dow Corning 340) between the control heat sink and the vehicle frame.

Control wire plugs and other exposed transistor control parts should be kept free of dirt and paint that might change the effective resistance between points.

CAUTION: The vehicle should not be plugged when the vehicle is jacked up and the drive wheels are in a free wheeling position. The higher motor speeds can create excessive voltages that can be harmful to the control.

Do not hipot (or megger) the control. Refer to control manufacturer before hipotting.

Use a lead-acid battery with the voltage and ampere hour rating specified for the vehicle. Follow normal battery maintenance procedures, recharging before 80 percent discharged with periodic equalizing charges.

Visual inspection of GE contactors contained in the traction and pump systems is recommended to occur during every 160 hours of vehicle operation. Inspection is recommended to verify that the contactors are not binding and that the tips are intact and free of contaminants.

GE does not recommend that any type of welding be performed on the vehicle after the installation of the control(s) in the vehicle. GE will not honor control failures during the warranty period when such failures are attributed to welding while the control is installed in the vehicle.

Section 4.2 Cable Routing and Separation

Electrical noise from cabling of various voltage levels can interfere with a microprocessor-based control system. To reduce this interference, GE recommends specific cable separation and routing practices, consistent with industry standards.

Section 4.2.1 Application Responsibility

The customer and customer’s representative are responsible for the mechanical and environmental locations of cables. They are also responsible for applying the level rules and cabling practices defined in this section. To help ensure a lower cost, noise-free installation, GE recommends early planning of cable routing that complies with these level separation rules.

On new installations, sufficient space should be allowed to efficiently arrange mechanical and electrical equipment.

On vehicle retrofits, level rules should be considered during the planning stages to help ensure correct application and a more trouble-free installation.

Section 4.2.2 Signal/Powerlevel Definitions

The signal/power carrying cables are categorized into four defining levels: low, high, medium power, and high power. Within those levels, signals can be further divided into classes.

Sections 4.2.2.a through 4.2.2.d define these levels and classes, with specific examples of each. Section 4.2.3 contains recommendations for separating the levels.

4.2.2.a Low-Level Signals (Level L)

Low-level signals are designated as level L. These consist of:

- Analog signals 0 through ±15 V
- Digital signals whose logic levels are less than 15 V DC
- 4 – 20 mA current loops
- DC busses less than 15 V and 250 mA

The following are specific examples of level L signals used in drive equipment cabling:
4.2.2.b High-Level Signals (Level H)

High-level signals are designated as level H. These signals consist of:

- Analog and digital signals greater than 15 V DC and less than 250 mA

For example, switch inputs connected to battery volts are examples of level H signals used in drive equipment cabling.

4.2.2.c Medium-Power Signals (Level MP)

Medium power signals are designated as level MP. These signals consist of:

- DC switching signals greater than 15 V
- Signals with currents greater than 250 mA and less than 10A

The following are specific examples of level MP signals used in drive equipment cabling:

- DC busses less than 10 A
- Contactor coils less than 10 A
- Machine fields less than 10 A

4.2.2.d High Power Signals (Level HP)

Power wiring is designated as level HP. This consists of DC buses and motor wiring with currents greater than 10 A. The following are specific examples of level HP signals used in drive equipment cabling:

- Motor armature loops
- DC outputs 10 A and above
- Motor field loops 10 A and above

4.2.3. Cable Spacing Guidelines

Recommended spacing (or clearance) between cables (or wires) is dependent on the level of the wiring inside them. For correct level separation when installing cable, the customer must apply the general guidelines (section 4.2.3.a), outlined below.

4.2.3.a General Cable Spacing

The following general practices should be used for all levels of cabling:

- All cables and wires of like signal levels and power levels must be grouped together.
- In general, different levels must run in separate wire bundles, as defined in the different classes, identified above. Intermixing cannot be allowed, unless noted by exception.
- Interconnecting wire runs should carry a level designation.
- If wires are the same level and same type signal, group those wires from one location to any other location together in multiconductor cables or bind them together with twine or zip-ties.
- When unlike signals must cross, cross them in 90° angles at a maximum spacing. Where it is not possible to maintain spacing, place a grounded steel barrier between unlike levels at the crossover point.

4.2.4 Cabling for Vehicle Retrofits

Reducing electrical noise on vehicle retrofits requires careful planning. Lower and higher levels should never encircle each other or run parallel for long distances. It is practical to use existing wire runs or trays as long as the level spacing (see section 4.2.2) can be maintained for the full length of the run.

Existing cables are generally of high voltage potential and noise producing. Therefore, route levels L and H in a path separate from existing cables, whenever possible.

For level L wiring, use barriers in existing wire runs to minimize noise potential.

Do not loop level L signal wires around level H, level MP, or HP wires.

4.2.5 RF Interference

To prevent radio frequency (RF) interference, care should be taken in routing power cables in the vicinity of radio-controlled devices.

Section 4.2.6 Suppression

Unless specifically noted otherwise, suppression (for example, a snubber) is required on all inductive devices controlled by an output. This suppression minimizes noise and prevents damage caused by electrical surges.
Section 4.3 Recommended Lubrication of Pins and Sockets Prior to Installation

Beginning in January of 1999, GE will implement the addition of a lubricant to all connections using pins and sockets on EV100/EV200 and Gen II products. Any connection made by GE to the A, B, X, Y, or Z plugs will have the lubricant NYE 760G added to prevent fretting of these connections during vehicle operation.

Fretting occurs during microscopic movement at the contact points of the connection. This movement exposes the base metal of the connector pin which, when oxygen is present, allows oxidation to occur. Sufficient build up of the oxidation can cause intermittent contact and intermittent vehicle operation. This can occur at any similar type of connection, whether at the control or in any associated vehicle wiring, and the resultant intermittent contact can provide the same fault indication as actual component failure.

The addition of the NYE 760G lubricant will prevent the oxidation process by eliminating the access of oxygen to the contact point. GE recommends the addition of this lubricant to the 12 pin and 23 pin plugs of all new Gen II controls at the time of their installation into a vehicle.

When servicing existing vehicles exhibiting symptoms of intermittent mis-operation or shutdown by the GE control, GE recommends the addition of this lubricant to all 12 and 23 pin plugs, after proper cleaning of the connectors, as a preventative measure to insure fretting is not an issue before GE control replacement. Also, for long term reliable control operation, the plug terminals must be maintained per these instructions with the recommended contact cleaner and lubricant which provides a high degree of environmental and fretting protection.

New and re-manufactured control plugs are cleaned and lubricated prior to shipment from the factory. However, in applications where severe vibration or high temperature cycling and excessive humidity (such as freezers) are present, it is recommended that the plug terminals be cleaned and lubricated every year, per this instructions. In normal applications, plug maintenance should be performed every two years, unless intermittent problems arise with the plugs, requiring more immediate attention. Warning: Do not use any other cleaners or lubricants other than the ones specified.

**WARNING: Before conducting maintenance on the vehicle, jack up the drive wheels, disconnect the battery and discharge the capacitors. Consult the Operation and Service Manual for your particular vehicle for details on discharging the capacitors; this procedure differs between SCR and Transistor controls.**

1. **Disconnect** plug from controller or mating plug.

2. **Locate** the plug that contains the socket (female) terminals. *Maintenance needs only to be performed on the plug containing the socket (female) type terminals. Reconnecting the plugs will lubricate the pin (male) terminals.*

3. **Clean** each terminal using Chemtronics® contact cleaner “Pow-R-Wash CZ” as shown in Figure 1.

4. **Lubricate** each terminal using Nye® 760G lubricant as shown in Figure 2. Apply enough lubricant to each terminal opening to completely fill each opening to a depth of .125” minimum.

5. **Reconnect** plugs.

September 2004
Section 4.4 General Troubleshooting Instructions

Trouble-shooting the SX family of controls should be quick and easy when following the instructions outlined in the following status code instruction sheets.

If mis-operation of the vehicle occurs, a status code will be displayed on the Dash Display (for vehicles equipped with a Dash Display) or made available by plugging a Handset into the plug “Y” location, and then reading the status code.

**Note:** Status code numbers from 00 to 99 are traction control status codes. Status codes with the prefix 1 (101 to 199) are pump control status codes.

With the status code number, follow the procedures outlined in the status code instruction sheets to determine the problem.

Important Note: Due to the interaction of the logic card with all vehicle functions, almost any status code or control fault could be caused by the logic card. After all other status code procedures have been followed and no problem is found, the controller should then be replaced as the last option to correct the problem.

The same device designations have been maintained on different controls but the wire numbers may vary. Refer to the elementary and wiring diagrams for your specific control. The wire numbers shown on the elementary diagram will have identical numbers on the corresponding wiring diagrams for a specific vehicle, but these numbers may be different from the numbers referenced in this publication.

**WARNING:** Before trouble-shooting, jack up the drive wheels, disconnect the battery and discharge the capacitors. Reconnect the battery as needed for specific checks. Capacitors should be discharged by connecting a 200 ohm 2 watt resistor between the positive and negative terminals on the control panel.

Check resistance on R x 1000 scale from frame to power and control terminals. A resistance of less than 20,000 ohms can cause misleading symptoms. Resistance less than 1000 ohms should be corrected first.

Before proceeding, visually check for loose wiring, mis-aligned linkage to the accelerator switch, signs of overheating of components, etc.

Tools and test equipment required are: clip leads, volt-ohm meter (20,000 ohms per volt) and basic hand tools.

### Traction Status Codes

#### -02

**Description of Status:** Forward directional switch is closed on initial power up.

**Cause of Status Indication:** This status code will be displayed when P4 is greater than 60% of battery voltage at initial key switch on.

#### Corrective Actions

**Symptom:** Control will not operate because of Static Return to Off (SRO) lockout.

**Possible Cause:**
- Forward directional switch is closed on initial start up (i.e. closure of battery, key switch or seat switch).
- Return directional switch lever to neutral and then return lever to forward position.
- Forward directional switch is welded closed or mis-adjusted to be held closed.
- Replace or adjust directional switch to insure that it opens when the directional switch is returned to neutral.
- Defective control.
  - Replace the controller unit.

#### Troubleshooting Diagram

![Traction Controller Diagram](image-url)

#### -03

**Description of Status:** Reverse directional switch is closed on initial power up.

**Cause of Status Indication:** This status code will be displayed when P5 is greater than 60% of battery voltage at initial key switch on.

#### Corrective Actions

**Symptom:** Control will not operate because of Static Return to Off (SRO) lockout.

**Possible Cause:**
- Reverse directional switch is closed on initial start up (i.e. closure of battery, key switch or seat/deadman switch).
- Return directional switch lever to neutral and then return lever to reverse position.
- Reverse directional switch is welded closed or mis-adjusted to be held closed.
- Replace or adjust directional switch to insure that it opens when the directional switch is returned to neutral.
- Defective control.
  - Replace the controller unit.

## Traction Status Codes

### Diagnostic Status Codes

<table>
<thead>
<tr>
<th>Traction Status Code</th>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>-09</td>
<td>Both the forward and reverse directional switches are closed at the same time.</td>
<td>This status code will be displayed when P4 and P5 are greater than 60% of battery volts at the same time.</td>
</tr>
</tbody>
</table>

**Corrective Actions**

- **Symptom**: Control will not operate.
- **Possible Cause**: Forward or reverse directional switch welded closed or mis-adjusted to be held closed.
- Replace or adjust directional switches to insure that they open when directional switch is returned to neutral.
- Short circuit between battery positive and P4 and/or P5.
- Disconnect wires from P4 and P5 and check wire for short circuit to positive side of directional switch.
- Defective Control
- Disconnect wires and measure voltage at P4 and P5. Voltage should be less than 60% of battery volts.

### Troubleshooting Diagram

![Traction Controller Diagram](image)

### Traction Status Code

<table>
<thead>
<tr>
<th>Traction Status Code</th>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>-11</td>
<td>Start switch closed on power up after initial key switch closure.</td>
<td>This status code will be displayed when P3 is greater than 60% of battery voltage when the key switch is closed.</td>
</tr>
</tbody>
</table>

**Corrective Actions**

- **Symptom**: Control will not operate.
- **Possible Cause**: Start switch input mis-adjusted or defective.
- Input voltage at P3 should be less than 60% of battery volts at key switch closing. Adjust or replace accelerator unit to ensure that the voltage at P3 is less than 60% of battery volts before closing the start switch.
- Short circuit between battery positive and P3 in start switch input circuit.
- Disconnect wire from P3. Check for short circuit from this wire to battery positive.
- Defective control.
- Disconnect wire from P3. Measure voltage from P3 to negative. Voltage should be zero, if not, replace control.

### Troubleshooting Diagram

![Traction Controller Diagram](image)
### Traction Status Code -15

<table>
<thead>
<tr>
<th>DESCRIPTION OF STATUS</th>
<th>CAUSE OF STATUS INDICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery voltage is too low or control card is mis-adjusted.</td>
<td>This status code will be displayed when the battery volts are less than 1.95 volts per cell at initial key switch on. See table below.</td>
</tr>
</tbody>
</table>

#### Corrective Actions

##### Symptom
Control will not operate.

##### Possible Cause
- Discharged battery
  - Check battery for proper open circuit voltage as shown in "Trouble Shooting Diagram", charge battery, if required.
- Defective battery
  - Check each battery cell for proper voltage (greater than 1.95 volts at cell). Replace or repair battery.
- Incorrect control card adjustment
  - Check Function 15 for proper adjustment for battery being used. See Handset instruction sheet for details. Adjust to proper settings.
- Check "minimum" battery volts at P1 and NEG.

#### Trouble-Shooting Diagram

#### Traction Status Code -16

<table>
<thead>
<tr>
<th>DESCRIPTION OF STATUS</th>
<th>CAUSE OF STATUS INDICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery voltage is too high or control card is mis-adjusted.</td>
<td>This status code will be displayed when the battery volts are greater than 2.4 volts per cell at initial key switch on. See table below.</td>
</tr>
</tbody>
</table>

#### Corrective Actions

##### Symptom
Control will not operate.

##### Possible Cause
- Incorrect control card adjustment
  - Check Function 15 for proper adjustment for battery being used. See Handset instructions for details. Adjust to proper setting.
- Battery over charged or incorrect battery used
  - Check battery for proper open circuit voltage per table at right. If voltage is excessive, check battery charger for proper output voltage.
- Check "maximum" battery volts at P1 and NEG.

#### Trouble-Shooting Diagram

### Remember
- The tables provide nominal battery voltage limits and minimum limit volts at specific voltages per cell. These should be checked to ensure the battery is within the acceptable range.

<td>The accelerator voltage is too high. Cycle the key switch off and on to clear the status code.</td>
<td>This status code will be displayed when the voltage at P7 is greater than 4.5 volts.</td>
</tr>
</tbody>
</table>

**MEMORY RECALL:**

**YES**

**CORRECTIVE ACTIONS**

**SYMPTOM**

Control will not operate. The key switch must be turned off and on to clear the status code.

**POSSIBLE CAUSE**

- Verify wire connection between accelerator pot to P8
- Verify wire connection between P7 to accelerator pot
- Verify that the accelerator pot is adjusted properly

## Traction Status Code -24

**Description of Status:**
Motor field current is high on start up in the forward direction.

**Cause of Status Indication:**
This status code will be displayed when the current draw in the motor field is too high at start up in the forward direction.

### Corrective Actions

- Circuits valid for Traction Controller
- **Symptom:** Control will not operate.
- **Possible Cause:**
  - Defective control.
  - Replace controller unit.

### Trouble-Shooting Diagram

_NO GRAPHIC FOR THIS STATUS CODE_

## Traction Status Code -27

**Description of Status:**
Control’s power supply is less than 10 Volts DC.

** Cause of Status Indication:**
This status code will be displayed when the control’s power supply is less than 10 volts.

### Corrective Actions

- Circuits valid for Traction Controller
- **Symptom:** Line contactor opens and closes, then can only be closed by opening and closing the key switch.
- **Possible Cause:**
  - Discharged Battery
  - Check battery to insure proper state of charge. Voltage may be dropping below 10 Volts DC under load.
  - Loose connection at P1.
  - Insure that the wire connection at P1 is tight.
  - Defective control.
  - Replace controller unit.

### Trouble-Shooting Diagram

<tr>
<td>-28</td>
<td>Motor field current is too high during the run mode.</td>
<td>This status code will be displayed when the current in the motor field is sustained above a preset limit for longer than 70 seconds.</td>
</tr>
</tbody>
</table>

#### Corrective Actions

**SYMPTOM**
Control will not operate.

**POSSIBLE CAUSE**
Continued operation of vehicle in high motor current condition.
- Operate vehicle at lower motor current condition for 70 seconds.

Function 7 is mis-adjusted to allow higher than normal motor field current.
- Adjust function per OEM instructions.

---

<table>
<thead>
<tr>
<th>Traction Status Code</th>
<th>Description of Status</th>

<tr>
<td>-41</td>
<td>Shorted thermal protector (TP) or armature transistor over temperature.</td>
<td>This status code will be displayed when the voltage at the thermal protector is too low.</td>
</tr>
</tbody>
</table>

#### Corrective Actions

**SYMPTOM**
Reduced or no power to traction motor in control range.

**POSSIBLE CAUSE**
Control is in thermal cut-back.
- Allow control to cool, status code should disappear.

Defective control.
- Replace controller unit.

---

The presence of this status code is not necessarily indicative of a control issue. If function 7 is not mis-adjusted, the status code indicates an application issue where a motor is being stalled, etc. Display of this status code should not trigger the return of a control for repair or replacement.

## Traction Status Codes

### SX Transistor Control

<table>
<thead>
<tr>
<th>Traction Status Code</th>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>-46</td>
<td>“Look Ahead” test for A2 volts less than 12% of battery volts.</td>
<td>This status code will be displayed when the voltage at A2 is less than 12% of battery volts.</td>
</tr>
</tbody>
</table>

### Corrective Actions

- **Symptom**: Line contactor will open.

- **Possible Cause**
  - Check for short circuit from the motor armature to the frame of the vehicle.
  - Check for welded 1A contactor (if used)
  - Defective control.
    - Replace controller unit.

### Troubleshooting Diagram

![Troubleshooting Diagram](image)

### Traction Status Code -47

<table>
<thead>
<tr>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Motor armature is open.</td>
<td>This status code will be displayed when the on-time is &gt;13%, and the current in the motor armature is &gt;-26 amps and &lt;26 amps for four seconds.</td>
</tr>
</tbody>
</table>

### Corrective Actions

- **Symptom**: Control will not operate. The status code is cleared when the armature current goes above 26 amps, or the control goes through neutral, or the percent on-tim goes below 17%. The code is only stored once in every twenty hours of occurrence.

- **Possible Cause**
  - Defective control or connection.
  - Replace controller unit.
  - Open motor armature.
<table>
<thead>
<tr>
<th>TRACTION STATUS CODE</th>
<th>DESCRIPTION OF STATUS</th>

### Traction Status Codes

<table>
<thead>
<tr>
<th>Traction Status Code</th>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>-76</td>
<td>Capacitor (1C) voltage too high.</td>
<td>This status code will be displayed when the voltage on the capacitor goes above limit voltage during the regenerative braking cycle.</td>
</tr>
</tbody>
</table>

#### Corrective Actions

**Symptom**
Line contactor opens and closes, then opens and can only close by opening and closing the key switch.

**Possible Cause**
- Unplugging the battery connector during regenerative braking.
- Line contactor bouncing open during regen.
- Main power fuse opening during regen.
- Intermittent battery plug connection.

*Limit Voltage:
- Limit 50V
- Batt. 36V
- Limit 70V
- Batt. 48V
- Limit 96V
- Batt. 72/80V

---

### Traction Status Code

<table>

<table>
<thead>
<tr>
<th>Traction Status Code</th>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>-82</td>
<td>If the armature motor current is greater than a preset value for longer than 3.5 sec the armature motoring current will be turned off.</td>
<td>This status code will be displayed when the armature motor current exceeds a preset value for 3.5 sec and the accelerator pedal is calling for maximum performance.</td>
</tr>
</tbody>
</table>

**Memory Recall:** Yes

**Corrective Actions:**

Symptom: The Control will not operate, and can only be reset by cycling the key switch.

Possible Cause:
- Continued operation of vehicle in high motor current condition
- Operating control at stall motor current for more than 3.5 seconds.
- Function 16 is incorrectly adjusted for control % on time.
  - Adjust function per OEM instructions

Trouble-Shooting Diagram:

The presence of this status code is not necessarily indicative of a control issue. If Function 16 is not mis-adjusted, the status code indicates an application issue where a motor is being stalled, etc. Display of this status code should not trigger the return of a control for repair or replacement.

<table>
<thead>
<tr>
<th>Traction Status Code</th>

<tr>
<td>-83</td>
<td>A switch position is incorrect during the accelerator potentiometer auto calibration routine.</td>
<td>This status code will be displayed when the seat switch is open, or the any of the forward, reverse or start switches are closed at the beginning of the accelerator potentiometer auto calibration routine.</td>
</tr>
</tbody>
</table>

**Memory Recall:** No

**Corrective Actions:**

Symptom: The auto calibration routine outlined in Section 8 of this manual will not start.

Possible Cause:
- Seat switch is open
  - Confirm switch wiring, or replace switch, if required.
- Any of the forward, reverse or start switches are closed
  - Confirm switch wiring, or replace switch, if required.

<th>Corrective Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>YES</td>
<td>Troubleshooting Diagram</td>
</tr>
<tr>
<td>Circuits valid for Traction Controller</td>
<td>NO DIAGRAM</td>
</tr>
</tbody>
</table>

**Symptom:** Status code is displayed for 4 seconds when the key switch is first turned on, and/or the vehicle may run at a reduced speed.

**Customer Selected Setting with the Handset:**

- Maintenance Code Hour Meter, Functions 19 and 20, are programmed with the Handset and command the display of status code -99.
- If desired, Maintenance Code Speed Limit, Function 13, can be programmed with the Handset.

User should perform the desired maintenance function. Re-set maintenance alert hour meter after maintenance is performed.

### Diagnostic Status Codes

#### Transistor Pump Control

<table>
<thead>
<tr>
<th>PUMP STATUS CODE</th>
<th>DESCRIPTION OF STATUS</th>
<th>CAUSE OF STATUS INDICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>-128</strong></td>
<td>Armature current is too high during the lift mode.</td>
<td>Status code displayed when the current in the armature circuit is sustained above 400A for 70 sec.</td>
</tr>
</tbody>
</table>

**MEMORY RECALL**

**YES**

**CORRECTIVE ACTIONS**

**SYMPTOM**

Control will not operate.

**POSSIBLE CAUSE**

Continued operation of vehicle in high motor current condition.

- Operate vehicle at lower motor current condition for 70 seconds.

#### Troubleshooting Diagram

*No graphic for this status code*

</thead>
<tbody>
<tr>
<td><strong>-141</strong></td>
<td>Shorted thermal protector (TP1) or transistor is over temperature.</td>
<td>This status code is displayed when the voltage at the thermal protector is less than 3.8 volts.</td>
</tr>
</tbody>
</table>

**MEMORY RECALL**

**YES**

**CORRECTIVE ACTIONS**

**SYMPTOM**

Reduced or no power to pump motor in control range.

**POSSIBLE CAUSE**

Control is in thermal cut-back.

- Allow control to cool, status code should disappear.

#### Troubleshooting Diagram

*No graphic for this status code*
### PUMP STATUS CODE -142

**Description of Status**: Pump Controller “motor current sensor” input is missing.

**Cause of Status Indication**: This status code is displayed when the voltage at the current sensor is greater than 1.6 volts with no current flowing in the motor circuit.

**Corrective Actions**: No memory recall.

**Symptom**: No power to pump motor in control range.

**Possible Cause**: Control is defective.
- Replace controller unit.

### Troubleshooting Diagram

![Troubleshooting Diagram](image-url)

### PUMP STATUS CODE -143

**Description of Status**: Pump Controller “motor current sensor” input is too low.

**Cause of Status Indication**: This status code is displayed when the voltage at the current sensor is less than 0.6 volts with no current flowing in the motor circuit.

**Corrective Actions**: No memory recall.

**Symptom**: No power to pump motor in control range.

**Possible Cause**: Control is defective.
- Replace controller unit.

<td></td>
</tr>
</tbody>
</table>
### PUMP STATUS CODE 146

**DESCRIPTION OF STATUS**  
“Look Ahead” test for T2 volts less than 12% of battery volts.

**CAUSE OF STATUS INDICATION**  
This status code will be displayed when the voltage at T2 is less than 12% of battery volts.

**CORRECTIVE ACTIONS**

- Circuits valid for Pump Controller
- **SYMPTOM**  
  Pump control will not operate.
- **POSSIBLE CAUSE**  
  Check for short circuit from the motor armature to the frame of the vehicle.
  Control is defective.
  - Replace controller unit.

### PUMP STATUS CODE 150

**DESCRIPTION OF STATUS**  
Capacitor volts are low after the line contactor closes.

**CAUSE OF STATUS INDICATION**  
This status code will be displayed when the capacitor voltage is less than 85% of the battery voltage in the run mode.

**CORRECTIVE ACTIONS**

- Circuits valid for Pump Controller
- **SYMPTOM**  
  Pump control will not operate.
- **POSSIBLE CAUSE**  
  Defective line contactor.
  - Check for open line contactor power tips.
  - Check for loose or open connections in cables from battery positive to control positive circuit.
  - Defective power fuse.
  - Check power fuse for open circuit.
- No battery voltage at P1.
  - Check for battery voltage at POS and P1.
  - Check for loose connection at P1.
<table>
<thead>
<tr>
<th>PUMP STATUS CODE</th>
<th>DESCRIPTION OF STATUS</th>
<th>CAUSE OF STATUS INDICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>-151</td>
<td>Capacitor volts are low before the line contactor closes. (Internal card function during pre-charge)</td>
<td>This status code will be displayed during “key on” when the capacitor volts is less than 85% of battery volts at initial key switch on.</td>
</tr>
</tbody>
</table>

**MEMORY RECALL**

**NO**

**CORRECTIVE ACTIONS**

**SYMPTOM**
Pump control will not operate.

**POSSIBLE CAUSE**
- Defective control.
- Replace controller unit.

*Note: Repeated “charging/discharging” the capacitors during troubleshooting will cause status code 51. Also “do not” connect any loads to the load side of the line contactor.*

### PUMP STATUS CODE -180

<table>
<thead>
<tr>
<th>DESCRIPTION OF STATUS</th>
<th>CAUSE OF STATUS INDICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage at capacitor (1C) is less than 14 volts.</td>
<td>This status code will be displayed when the voltage at P1 is less than 14 volts. This occurs typically in the run mode of operation.</td>
</tr>
</tbody>
</table>

#### CORRECTIVE ACTIONS

**SYMPTOM**

Pump control will not operate.

**POSSIBLE CAUSE**

- (Line contactor controlled by traction control).
- Line Contactor opened up during run.
- Check connection from P17 to Line coil (+) for loose connection.
- Check connection from battery (+) to Line coil (+) for loose connection.
- Check power connection from battery (+) to contactor L.
- Check for blown power fuse at pump control.
- Check for dirty contactor tips.

#### TROUBLE-SHOOTING DIAGRAM

![Trouble-Shooting Diagram]

### PUMP STATUS CODE -181

<table>
<thead>
<tr>
<th>DESCRIPTION OF STATUS</th>
<th>CAUSE OF STATUS INDICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery voltage is less than 14 volts.</td>
<td>This status code will be displayed when the battery voltage measured at P1 is less than 14 volts.</td>
</tr>
</tbody>
</table>

#### CORRECTIVE ACTIONS

**SYMPTOM**

Pump control will not operate.

**POSSIBLE CAUSE**

- Check connection from control fuse to pump P1 for loose connections.
- Check for low battery volts under load.
### Diagnostic Status Codes

#### Transistor Pump Control

<table>
<thead>
<tr>
<th>Pump Status Code</th>
<th>Description of Status</th>
<th>Cause of Status Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>-189</td>
<td>Input switch closed before pump enable signal is received.</td>
<td>This status code will be displayed when pin 12, 19, 20 or 21 is pulled to negative before pin 10 is greater than 5.0 volts.</td>
</tr>
</tbody>
</table>

#### Memory Recall

**No**

**Corrective Actions**

**Symptom**

Pump control will not operate.

**Possible Cause**

- Hydraulic handle pulled before pump enable signal given.
- Shorted hydraulic switch
- Defective control.

#### Trouble-Shooting Diagram

[Image of Trouble-Shooting Diagram]

---

September 2004
Section 5. TRUCK MANAGEMENT MODULE (TMM)

Section 5.1 General Features

The Truck Management Module is a multi-functional accessory card (IC364STMM7A), or an integral function of the SR Pump control when used with the SX Family of Traction controls. The Module provides the OEM with the ability to initiate status codes or operator warning codes to be displayed on the Dash Display whenever a normally open switch or sensor wire provides a signal to the Module.

The TMM Module can be used to display a separate status code indicating an over temperature of traction motors, hydraulic motors, or any other device or system that can activate a switch that closes.

It can also be used as a Brush Wear Indicator (BWI). The Brush Wear Indicator is designed to detect a “worn-out brush” and display a fault code on the Dash Display to warn maintenance personnel that the motor brushes need to be replaced before they wear to the point of causing destructive damage to the motor commutator surface. The BWI function is compatible with any sensor that short circuits to the motor armature to signal limits of brush wear.

Note: Motor armature must be in the positive side of the battery circuit.

Section 5.2 Operation

The Module utilizes 9 OEM input points and 3 output points that connect to the "Y" plug on the traction logic card. Due to the low level signal value of this output, shielded wire should always be used to insure proper operation. The input to the Module is either a switch or sensor wire closure to battery negative or positive. The following table outlines the status code displayed for each input, when that point is closed to battery negative or positive, as indicated.

<table>
<thead>

<td>Pos</td>
</tr>
</tbody>
</table>

* Status codes 90 and 93 can also be programmed with the Handset to reduce the speed of the truck from 100 to 0 percent-on-time.

Section 5.3 Installation

WARNING: Before any adjustments, servicing or act requiring physical contact with working components, jack drive wheels off the floor, disconnect the battery and discharge the capacitors in the traction and pump controls, as explained in Section 4.4.

The TMM7A accessory card should be mounted to a flat surface (in any plane) in an area protected from water, oil and battery acid. Mounting dimensions are shown in Section 5.5. Two (0.187 inch, 4.75mm) mounting holes are provided.

Section 5.4 Connection Diagrams

Section 5.4.1 TMM7A Card Connections

Section 5.4.2 Typical Brush Wear Sensor Connections
Section 5.4.3 TMM Pump Control Connections

Section 5.4.4 Typical Brush Wear Sensor Connections For Pump Control

Section 5.5 TMM7A Outline Drawings
Section 6. SX FAMILY GE HANDSET INSTRUCTIONS

Section 6.1 General Features
The GE Handset is a multi-functional tool to be used with the LX, ZX, and SX Series GE solid-state controls. The Handset consists of a Light Emitting Diode (LED) display and a keyboard for data entry.

Note: The Handset is the same for all GE controls, however, the cable will change between some control types.

Section 6.2 Purpose / Setup Functions
The purpose of the Handset is to allow authorized personnel to perform the following functions of the SX family of Controls:

- Monitor existing system fault codes
- Monitor intermittent random fault codes
- Monitor battery state of charge on systems with BDI
- Monitor hourmeter reading
- Monitor or adjust the following control functions:
  - Creep speed
  - Armature Controlled Acceleration and 1A Time
  - Regenerative Braking Current Limit
  - Armature and Field Current Limit
  - Speed Limit Points
  - Truck Management Fault Speed Limit
  - Internal Resistance Compensation for Battery State of Charge Indication
  - Battery Voltage (36/48 volts is auto ranging)
  - Selection of Card Operation Type.

Warning: Before connecting or disconnecting the Handset tool, turn off the key switch, unplug the battery and jack up the drive wheels of the vehicle.

At the transistor control traction card, unplug the "Y plug" if the dash display is in use, and plug in the Handset to the plug location "Y" on the control card. After installing the Handset tool, plug the battery in and turn the key switch on. The following is the start-up display sequence that will occur:

NOTE: The vehicle can be operated with the Handset connected, however, the adjustment knob must be set fully clockwise to insure the control operates at top speed.

Warning: Before making any adjustments to the control, you must consult the operating and maintenance instructions supplied by the vehicle manufacturer. Failure to follow proper set up instructions could result in misoperation or damage to the control system.
Section 6.3 Set-up Function Procedures

With the Handset connected, hold down the CONT key and turn on the key switch. This will place you in the set-up mode, ready to monitor or adjust control function settings.

NOTE: The term “Push” means to depress key for approximately one second.

Section 6.3.1 Setup Mode

<table>
<thead>
<tr>
<th>ACTION</th>
<th>DISPLAY SHOWS</th>
<th>REMARKS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hold Down CONT And Turn On Key</td>
<td>8 8 8 8</td>
<td>Segment Check Displayed</td>
</tr>
<tr>
<td>Push Function Number</td>
<td>U 0 0 5</td>
<td>Selected Function No. Is Displayed</td>
</tr>
<tr>
<td>After One Second Time Delay</td>
<td>0 8 5</td>
<td>Stored Value For The Function Is Displayed</td>
</tr>
<tr>
<td>Push CONT</td>
<td>0 8 5</td>
<td>Display Value Will Blink</td>
</tr>
<tr>
<td>Change Value With Adjustment Knob</td>
<td>125</td>
<td>Value Changes While Blinking</td>
</tr>
<tr>
<td>Push STORE</td>
<td>125</td>
<td>New Value Stored And Blinking Stops</td>
</tr>
<tr>
<td>Push ESC</td>
<td>8 8 8 8</td>
<td>Segment Check Displayed</td>
</tr>
</tbody>
</table>

At this point, another function can be monitored/changed by pushing another function number, or the vehicle can be placed in the run mode by holding the ESC key down for one second or longer. The display will return to either the diagnostics mode, the BDI display, or a blank display (if BDI is not used and there are no fault codes). The vehicle can now be operated with the Handset connected, or the Handset can be disconnected before operation.

NOTE: You can return to the segment check mode at any time, by holding down the ESC key until 8888 appears in the display.

Section 6.3.2 Status CodeScrolling

The SX family of controllers furnishes a function register that contains the last 16 “stored status codes” that shut down vehicle operation (a PMT type fault that is reset by cycling the key switch) and the battery state of charge reading at the time the fault occurred. The first of the 16 status codes will be overwritten each time a new status code occurs. This stored status code register can be cleared from memory by using the Handset.

Section 6.3.3 SX Family Handset, Plug Connections and Outline Drawing

“Y” Plug

Handset Cable Part Number - 328B1002G1
Section 6.4 Setup Functions for Traction Controller

FUNCTION 1 ADJUSTABLE MOTOR EMF FOR PLUGGING OR REGEN (Push 1)

This function allows for the adjustment of the level of motor EMF required for plugging or regenerative braking. The control will default to standard regen functionality if the setting is higher than a value of 60.

<table>
<thead>
<tr>
<th>Range</th>
<th>0 to 95.6 volts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set</td>
<td>0 to 255</td>
</tr>
<tr>
<td>Resolution</td>
<td>0.375 volts per set unit</td>
</tr>
<tr>
<td>Example:</td>
<td>Setting of 20 = 7.5 volts</td>
</tr>
</tbody>
</table>

FUNCTION 2 CREEP SPEED (Push 2)

This function allows for the adjustment of the creep speed of the vehicle. Creep speed can add 13% to the percent on time at the slowest speed range.

<table>
<thead>
<tr>
<th>Range</th>
<th>2% to 15% on time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set</td>
<td>0 to 255</td>
</tr>
<tr>
<td>Resolution</td>
<td>0.05% per set unit</td>
</tr>
<tr>
<td>Example:</td>
<td>Setting of 20 = 3% on time</td>
</tr>
</tbody>
</table>

FUNCTION 3 ARMATURE CONTROLLED ACCELERATION (Push 3)

This function allows for the adjustment of the rate of time it takes for the control to accelerate to 100% applied battery voltage to the motor on hard acceleration.

<table>
<thead>
<tr>
<th>Range</th>
<th>0.025 to 6.3 seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set</td>
<td>0 to 255</td>
</tr>
<tr>
<td>Resolution</td>
<td>0.025 seconds per set unit</td>
</tr>
<tr>
<td>Example:</td>
<td>Setting of 20 = 0.5 seconds</td>
</tr>
</tbody>
</table>

FUNCTION 4 ARMATURE CURRENT LIMIT (Push 4)

This function should always remain set at 255 (maximum current limit) for this family of controls.

FUNCTION 5 COUNTER EMF TRIP POINT FOR AUTO BRAKING (Push 5)

This function allows for the adjustment of the speed at which the truck will activate auto braking, after the accelerator pedal is released. The truck speed correlates to the amount of voltage produced by the traction motor when it is coasting. The setting of this function represents the motor voltage.

<table>
<thead>
<tr>
<th>Range</th>
<th>0 to 100 volts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set</td>
<td>0 to 255</td>
</tr>
<tr>
<td>Resolution</td>
<td>0.392 volts per set unit</td>
</tr>
<tr>
<td>Example:</td>
<td>Setting of 20 = 7.84 volts</td>
</tr>
</tbody>
</table>

FUNCTION 6 AUTO CALIBRATION OF ACCELERATOR POTENTIOMETER (Push 6)

This function allows for the auto calibration of the accelerator potentiometer. This function should be left set to a value of zero during normal truck operation. To activate the auto calibration routine, set this function to a value between 15 and 20, and refer to Section 8.0 of this handbook for detailed instructions covering the auto calibration procedure.

FUNCTION 7 MIN FIELD CURRENT (Push 7)

This function allows the adjustment of the field weakening level in order to set the top speed of the motor.
### Resolution Example

<table>
<thead>
<tr>
<th>Rating</th>
<th>Min</th>
<th>Max</th>
<th>Set</th>
<th>Resolution Per unit value</th>
<th>Example If set at 71</th>
</tr>
</thead>
<tbody>
<tr>
<td>36/48V</td>
<td>0</td>

<tr>
<td>72/80V</td>
<td>0</td>
<td>17</td>
<td>51 to 114</td>
<td>0.269 amps</td>
<td>5.38A</td>
</tr>
<tr>
<td>1000A</td>
<td>0</td>
<td>20</td>
<td>51 to 90</td>
<td>0.507 amps</td>
<td>10.14A</td>
</tr>
</tbody>
</table>

**MIN $I_F = (VAL-51) \times 0.314$ (at 36/48 Volts)**

**MIN $I_F = (VAL-51) \times 0.269$ (at 72/80 Volts)**

**MIN $I_F = (VAL-51) \times 0.507$ (at 1000 Amps)**

**Important Note:** This function is used to optimize motor and control performance and this setting will be determined by GE and OEM engineers at the time of vehicle development. This setting must not be changed by field personnel without the permission of the OEM.

### FUNCTION 8 MAX FIELD CURRENT (Push 8)

This function allows for the adjustment of the maximum field current in order to obtain the maximum torque of the motor. This function should always be set to 255.

### FUNCTION 9 REGEN BRAKING CURRENT LIMIT (Push 9)

This function allows for the adjustment of the maximum current seen by the motor during regenerative braking; the higher the current, the shorter the stopping distance.

<table>
<thead>
<tr>
<th>Volts</th>
<th>Min</th>
<th>Max</th>
<th>Set</th>
<th>Resolution Per unit value</th>
<th>Example If set at 100</th>
</tr>
</thead>
<tbody>
<tr>

<td>51 to 255</td>
<td>0.314</td>
<td>53 amps</td>
</tr>
<tr>
<td>72/80V</td>
<td>0</td>
<td>55</td>
<td>51 to 255</td>
<td>0.269</td>
<td>45 amps</td>
</tr>
<tr>
<td>1000A</td>
<td>0</td>
<td>103</td>
<td>51 to 255</td>
<td>0.507</td>
<td>85 amps</td>
</tr>
</tbody>
</table>

**$I_F = (VAL-51) \times 0.314$ (at 36/48 volts)**

**$I_F = (VAL-51) \times 0.269$ (at 72/80 volts)**

**$I_F = (VAL-51) \times 0.507$ (at 1000 amps)**

### FUNCTION 11 BRAKE SWITCH CURRENT LIMIT (Push 11)

This function allows for the adjustment of the maximum motor armature current when the voltage at Pin 12 is less than 50% of battery voltage. The 1A contactor will not close, if the brake switch current is active.

**Range** 160 amps to 575 amps  
**Set** 0 to 255  
**Resolution** 160 amps + (VALUE x 1.63 amps)  
**Example** Setting of 100 = 323 amps

### FUNCTION 12 TOP SPEED LIMIT (Push 12)

This function allows for the adjustment of the motor speed limit (maximum battery volts to the motor). This speed limit is the same as function 11, however it is always active.

**Range** 100% to 0% battery volts  
**Set** 46 to 180  
**Resolution** 0.75% per set unit  
**Example** Setting of 80 = 75% of battery volts

**SPEED LIMIT = 100% - ((VAL-46) x 0.75%)**

### FUNCTION 13 MAINTENANCE AND TRUCK MANAGEMENT SPEED LIMIT (Push 13)

This function is the same as function 11, however it is active based on maintenance hours, or traction motor overheating or on low BDI value.

**Range** 100% to 0% battery volts  
**Set** 46 to 180  
**Resolution** 0.75% per set unit  
**Example** Setting of 80 = 75% of battery volts

**SPEED LIMIT = 100% - ((VAL-46) x 0.75%)**

### FUNCTION 14 INTERNAL RESISTANCE COMPENSATION (Push 14)

This function is used when the Battery Discharge Indicator is present. Adjustment of this function will improve the...
accuracy of the BDI. In order to determine this setting the voltage drop of the battery under load must first be calculated by the following method. This function can be changed by the dash display mode selection button.

1. On a fully charged battery, record the open circuit voltage \( V_o \) by measuring the voltage at the control positive and negative power terminals.
2. Load the traction motor to 100 amps in 1A and record the voltage \( V_l \) at the control positive and negative power terminal.
3. Calculate voltage drop \( V_{\text{drop}} \) as follows:
   \[ V_{\text{drop}} = V_o - V_l \]
4. Use the table below to determine the appropriate setting using the calculated \( V_{\text{drop}} \) as a reference.

### INTERNAL RESISTANCE COMPENSATION TABLE

### FUNCTION 15 BATTERY VOLTS
(Push I5)

This function allows for the adjustment of voltage range for controls equipped with the Battery Discharge Indication function. In order for the BDI to operate properly, the setting as shown in the table must be entered:

- **Battery volts**: Set units
  - 36 volts: Between 32 and 44
  - 48 volts: Between 45 and 69
  - 72 volts: Between 70 and 80
  - 80 volts: Between 81 and 183
  - 36/48 volts: Between 184 and 250
  - No BDI: Between 251 and 255

### FUNCTION 16 STALL PROTECTION % ON-TIME TRIP POINT
(Push CONT 1)

This function allows for the adjustment of the stall motor protection, as well as the display and storing of an 82 fault code. This function adjusts the percent on time at which the fault occurs when the accelerator is calling for greater than 50% speed and the armature current is above 500 amps at 36/48V (or above 370 amps at 72/80V).

- **Range**: 100% to 0% battery volts
- **Set**: 46 to 180
- **Resolution**: 0.75% per set unit
- **Example**: Setting of 125 = 41% on-time

\[ \% \text{ ON TIME} = 100\% - \left( \frac{\text{VAL} - 46}{0.75} \right) \]

**Important Note**: This function is used to optimize motor and control performance, and this setting will be determined by GE and OEM engineers at the time of vehicle development. This setting must not be changed by field personnel without the permission of the OEM.

### FUNCTION 17 CARD TYPE SELECTION
(Push CONT 2)

This function allows the user to enable or disable the vehicle’s auto braking routine by setting the function within the ranges outlined below.

<table>
<thead>

</tbody>
</table>
FUNCTION 18   STEER PUMP TIME DELAY
( Push CONT 3 )

This function allows for the selection of steer pump contactor pick up input, either seat switch or directional switch closing, as well as the adjustment of the time delay for the contactor drop out.

- Pick up steer pump contactor on seat switch closure and drop out steer pump contactor on seat switch opening, after a delay determined by the following:

  Range 1.5 to 65 seconds
  Setting Between 0 and 127
  Resolution 0.5 seconds per set unit

Example: Setting of 20 = (20 x 0.5) + 1.5 = 11.5 seconds

- Pick up steer pump contactor on directional switch closure and drop out steer pump contactor on directional switch opening, after a delay determined by the following:

  Range 0.5 to 63 seconds
  Setting Between 128 and 255
  Resolution 0.5 seconds per set unit

Example: Setting of 149 = ((149-128) x 0.5) + 1.5 = 11.5 seconds

Note: If the seat switch opens, the steer pump contactor will open immediately.

FUNCTION 19   MAINTENANCE CODE TENS AND UNITS HOURS SET
( Push CONT 4 )

This function allows for the adjustment of the tens and units hours of the maintenance code activation time.

Range 0 to 99
Set 0 to 99
Example 9999 Hours

FUNCTION 20   MAINTENANCE CODE THOUSANDS AND HUNDREDS HOURS SET
( Push CONT 5 )

This function allows for the adjustment of the thousands and hundreds hours of the maintenance code activation time.

Range 0 to 414 Amps
Set 0 to 255
Resolution 1.625 per set unit
Example Setting of 20 = 32.5 amps

FUNCTION 21   AUTO REGEN BRAKING CURRENT LIMIT
( Push CONT 6 )

This function allows for the adjustment of the braking torque applied when the start or directional switch is opened, and the counter EMF is above the setting of Function 5. A higher current correlates to a shorter stopping distance.

Current = (Value of Setting /4) x 6.5

Note, if the result is less than 52 amps, the control will default to 52 amps.

FUNCTION 22   NOT APPLICABLE

This value changes with operating mode selected, and should not be adjusted in the field.

FUNCTION 23   REGEN CANCEL CURRENT
( Push CONT 8 )

This function allows for the adjustment of the armature current at which regenerative braking cancels, and is specific to each motor design.

Important Note: This function is used to optimize motor and control performance, and this setting will be determined by GE and OEM engineers at the time of vehicle development. This setting must not be changed by field personnel without the permission of the OEM.

FUNCTION 24   FIELD WEAKENING START
( Push CONT 9 )

This function allows for setting the armature current at which minimum field current will be achieved.

Range 0 to 414 Amps
Set 0 to 255
Resolution 1.625 per set unit
Example Setting of 20 = 32.5 amps

FUNCTION 25   MONITOR
( Push CONT 10 )

I_{MOTOR\ FWS} = VAL. x 1.625
This function allows the monitoring of certain control functions by looking directly at the RAM of the microprocessor. Because absolute memory locations need to be known, this function should not be used without detailed instructions from the GE application engineer.

This function should only be adjusted by the vehicle OEM. To ensure optimum operation of the control, this function must be left with zero stored in this register.

**FUNCTION 26 FIELD TO ARMATURE CURRENT RATIO**

( Push CONT 11)

This function sets the ratio between armature and field current when operating below the maximum field current and above the Field Weakening Start point. The setting represents the quantity of field current changed for each 1 amp of armature current changed.

For a 36/48V control:
- Range: 0 to 0.314 field amps/armature amp
- Setting: 0 to 13
- Resolution: 0.024 field amps/armature amp
- Example: Setting of 10 = 0.24 field amps/armature amp

For a 72/80V control:
- Range: 0 to 0.269 field amps/armature amp
- Setting: 0 to 13
- Resolution: 0.021 field amps/armature amp
- Example: Setting of 10 = 0.20 field amps/armature amp

For a 1000A control:
- Range: 0 to 0.507 field amps/armature amp
- Setting: 0 to 13
- Resolution: 0.038 field amps/armature amp
- Example: Setting of 10 = 0.38 field amps/armature amp

**FUNCTION 27 MINUTES REGISTER**

(Push CONT 12)

This register is only intended for storage of the minutes value for proper operation of the hour meter and should not be adjusted.

**FUNCTION 28 STORED STATUS CODE COUNT POINTER**

( Push CONT 13)

This register contains the location of the last stored status code recorded of the 16 stored status codes. These stored status codes have caused a PMT controller shutdown and/or disruption of normal vehicle operation.

To determine which stored status code was the last one recorded, read the number stored in Function 28. Using the Memory Map for your logic card, match the "stored status code pointer number" (the number shown in **bold italics** in the HS (Handset) number column) on the memory map, with the number obtained from Function 28. This will be the last stored status code recorded.

Note: When scrolling through the stored status code register, the register always starts at status code 1 and scrolls to status code 16. Instructions for scrolling the register are in section 6.3.2 of this instruction booklet.

**FUNCTION 29 POWER STEERING HOURS**

(ONES AND TENS)

( Push CONT 14)

This register is only intended for storage of the ones and tens values of the hours of operation of the power steering motor and should not be adjusted.

**FUNCTION 30 POWER STEERING HOURS**

(HUNDREDS AND THOUSANDS)

( Push CONT 15)

This register is only intended for storage of the hundreds and thousands values of the hours of operation of the power steering motor and should not be adjusted.

**DASH DISPLAY INTERACTIVE MODES**

The following functions (functions 48 through 63) are mode settings that are activated from the Interactive Dash Display. Each function must be set using the logic table shown below. If you try to set this function outside these guidelines, an error code will be displayed to prompt you to enter the correct setting.

**The following functions have function numbers larger than the numbers on the Handset keyboard. To access these functions, Push the CONT key and the number shown in the following instructions at the same time. THE SEAT SWITCH MUST BE CLOSED.**

**FUNCTION 48 MODE 1 ARMATURE CONTROLLED ACCELERATION**

( Push CONT 1)

This function allows for the adjustment of the rate of time it takes for the control to accelerate to 100% applied battery voltage to the motor on hard acceleration.
ADJUSTABLE FEATURES
SX TRANSISTOR CONTROLS

Range: 1.0 to 25.5 seconds
Set: 10 to 255
Resolution: 0.10 seconds per set unit
Example: Setting of 20 = 2.0 seconds

This C/A takes effect when the Mode 1 settings are called for by the interactive Dash Display.

FUNCTION 49  MODE 1 REGEN CURRENT LIMIT
( Push CONT 2 )

This function allows for the adjustment of the maximum current seen by the motor during regenerative braking; the higher the current, the shorter the stopping distance.

<table>
<thead>
<tr>
<th>Volts</th>
<th>Min</th>
<th>Max</th>
<th>Set</th>
<th>Resolution Per unit value</th>
<th>Example If set at 100</th>
</tr>
</thead>

<td>0 to 255</td>
<td>1.625</td>
<td>344 amps</td>
</tr>
<tr>
<td>72/80</td>
<td>52A</td>
<td>409A</td>
<td>32 to 255</td>
<td>1.625</td>
<td>162 amps</td>
</tr>
</tbody>
</table>

REGEN BRAKE $I_a = (\text{VAL} \times 1.625) + 182$ at 36/48 volts
REGEN BRAKE $I_a = (\text{VAL} \times 1.625) + 182$ at 72/80 volts

This REGEN CURRENT LIMIT takes effect when the Mode 1 settings are called for by the interactive Dash Display.

FUNCTION 50  MODE 1 AUTO REGEN CURRENT LIMIT
( Push CONT 3 )

This function allows for the adjustment of the braking torque applied when the start or directional switch is opened, and the counter EMF is above the setting of Function 5. A higher current correlates to a shorter stopping distance.

Current = (Value of Setting /4) x 6.5

Note, if the result is less than 52 amps, the control will default to 52 amps.

This AUTO REGEN CURRENT LIMIT takes effect when the Mode 1 settings are called for by the interactive Dash Display.

FUNCTION 51  MODE 1 SPEED LIMIT 2
( Push CONT 4 )

This function allows for the adjustment of the motor speed limit (maximum battery volts to the motor.

Range: 100% to 0% battery volts
Set: 46 to 180
Resolution: 0.75% per set unit

Example Setting of 80 = 75% of battery volts
SPEED LIMIT = 100% - ((\text{VAL}-46) \times 0.75%)

This SPEED LIMIT 2 takes effect when the Mode 1 settings are called for by the interactive Dash Display.

FUNCTION 52  MODE 2 ARMATURE CONTROLLED ACCELERATION
( Push CONT 5 )

Same as Function 48.

This C/A takes effect when the Mode 2 settings are called for by the interactive Dash Display.

FUNCTION 53  MODE 2 REGEN CURRENT LIMIT
( Push CONT 6 )

Same as Function 49.

This REGEN CURRENT LIMIT takes effect when the Mode 2 settings are called for by the interactive Dash Display.

FUNCTION 54  MODE 2 AUTO REGEN CURRENT LIMIT
( Push CONT 7 )

Same as Function 50.

This AUTO REGEN CURRENT LIMIT takes effect when the Mode 2 settings are called for by the interactive Dash Display.

FUNCTION 55  MODE 2 SPEED LIMIT 2
( Push CONT 8 )

Same as Function 51.

This SPEED LIMIT 2 takes effect when the Mode 2 settings are called for by the interactive Dash Display.

FUNCTION 56  MODE 3 ARMATURE CONTROLLED ACCELERATION
( Push CONT 9 )

Same as Function 48.

This C/A takes effect when the Mode 3 settings are called for by the interactive Dash Display.
FUNCTION 57  MODE 3 REGEN CURRENT LIMIT
( Push CONT 10 )

Same as Function 49.
This REGEN CURRENT LIMIT takes effect when the Mode 3 settings are called for by the interactive Dash Display.

FUNCTION 58  MODE 3 AUTO REGEN CURRENT LIMIT
( Push CONT 11 )

Same as Function 50.
This AUTO REGEN CURRENT LIMIT takes effect when the Mode 3 settings are called for by the interactive Dash Display.

FUNCTION 59  MODE 3 SPEED LIMIT 2
( Push CONT 12 )

Same as Function 51.
This SPEED LIMIT 2 takes effect when the Mode 3 settings are called for by the interactive Dash Display.

FUNCTION 60  MODE 4 ARMATURE CONTROLLED ACCELERATION
( Push CONT 13 )

Same as Function 48.
This C/A takes effect when the Mode 4 settings are called for by the interactive Dash Display.

FUNCTION 61  MODE 4 REGEN CURRENT LIMIT
( Push CONT 14 )

Same as Function 49.
This REGEN CURRENT LIMIT takes effect when the Mode 4 settings are called for by the interactive Dash Display.

FUNCTION 62  MODE 4 AUTO REGEN CURRENT LIMIT
( Push CONT 15 )

Same as Function 50.
This AUTO REGEN CURRENT LIMIT takes effect when the Mode 4 settings are called for by the interactive Dash Display.

FUNCTION 63  MODE 4 SPEED LIMIT 2
( Push CONT ESC )

Same as Function 51.
This SPEED LIMIT 2 takes effect when the Mode 4 settings are called for by the interactive Dash Display.
Section 6.5 Summary of Current Limit Adjustments

The "maximum field current" setting is adjusted by Function 8. This function, along with the "armature current limit", Function 4, sets the maximum torque of the motor.

The "minimum field current" setting is adjusted by Function 7. The function sets the top speed of the motor.

The "armature current limit" setting is adjusted by Function 4. The function along with the "maximum field current", Function 8, sets the maximum torque of the motor.

The "ratio" setting is adjusted by Function 26. This function sets the ratio between armature and field current when operating. $I_{\text{MOTOR}}$ is above FWS and less than the full load transition point. Setting is the value of field current changed for each 100 amps of armature current changed.

The "field weakening start" setting is adjusted by Function 24. This function sets the armature current at which minimum field current will be achieved.

The "full load transition point"
Section 6.6 Setup Functions for Hydraulic Pump Control

FUNCTION 1 Not Applicable

This function is not applicable to this type of control and should not be adjusted.

FUNCTION 2 Internal Resistance Compensation Start (Push 2)

This function allows for the adjustment of the current level at which the internal resistance compensation feature (Function 16) will take effect.

Range: 0 to 1325 amps
Setting: 52 to 255
Resolution: 6.5 amps per set unit

Example: Setting of 72 = (72-52) x 6.5 = 130 amps

FUNCTION 3 Controlled Acceleration (Push 3)

This function allows for the adjustment of the rate of time it takes for the control to accelerate to 96% applied battery voltage to the motor on hard acceleration.

Range: 0.1 to 5.5 seconds
Setting: 0 to 255
Resolution: 0.021 seconds per set unit

Example: Setting of 20 = 0.52 seconds C/A

FUNCTION 4 Armature Current Limit (Push 4)

This function allows for the adjustment of the current limit of the control. The setting for this function should always remain at 255 for this family of controls to achieve maximum current limit.

FUNCTION 5 Internal Resistance Compensation Rate (Push 7)

This function allows for the adjustment of the rate of time it takes for the control to add the internal resistance compensation voltage that is applied to the motor. This function will add 0.375 volts to the motor at the rate of time adjusted until the total IR compensation voltage has been added.

FUNCTION 6 Adjustable Features

TRANSISTOR PUMP CONTROLS

Range: 0.0015 to 0.383 seconds
Setting: 0 to 255
Resolution: 0.0015 seconds per set unit

Example: Setting of 20 = 0.032 seconds
For example, if you had selected 2.08 volts from Function 16 to be added to the motor, it would take 0.18 seconds to add a total of 2.08 volts. (2.08/0.375)=0.032

FUNCTION 11 Aux 1/Aux 2 Speed Limit 1 (SL1) (Push 11)

This function allows for the adjustment of the speed limit (maximum battery volts to the motor) when the SL1 limit switch input signal is received by the control card. SL1 limit switch is a normally open switch connected to battery negative, the switch closing enables speed limit.

Range: 0% to 100% battery volts
Setting: 0 to 255
Resolution: 0.375 volts per set unit

Example: Setting of 50=18.75 volts

FUNCTION 12 Lift 1 Speed Limit 2 (SL2) (Push 12)

Same as Function 11 except using SL2 limit switch for input.

FUNCTION 13 Tilt Speed Limit 3 (SL3) (Push 13)

Same as Function 11 except using SL3 limit switch for input.

FUNCTION 14 Lift 2 Speed Limit (SL4) (Push 14)

Same as Function 11 except using SL4 limit switch for input.

FUNCTION 15 Not Applicable

Note: The following functions have function numbers larger than the numbers on the Handset keyboard. To access these functions, push the CONT key and the number shown in the following instructions at the same time. THE KEY SWITCH MUST BE CLOSED.
This function is not applicable to this type of control and should not be adjusted.

**FUNCTION 16: SPEED / TORQUE COMPENSATION (Push CONT 1)**

This function is used to stabilize pump speed at heavy loads. The voltage selected will be added to the motor at each 100 amp increment starting at the value set in Function 2. The voltage compensation selected will be added in increments of 0.375 volts until the entire voltage is added. For example, a setting of 2 will be added in 30 steps of 0.375 volts each whereas, a setting of 4 will be added in 15 steps of 0.375 volts each.

**SPEED / TORQUE COMPENSATION TABLE**

**FUNCTION 17: CARD TYPE SELECTION (Push CONT 2)**

This function should be set in accordance with the control type in use in the vehicle:

<table>
<thead>
<tr>
<th>Function</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Std C/L BDI Lockout</td>
<td>54 to 62</td>
</tr>
<tr>
<td>High C/L BDI Lockout</td>
<td>63 to 71</td>
</tr>
</tbody>
</table>

BDI Lockout means that the BDI signal from the traction control must be present in order for the pump control to operate. This control will stop operation when the battery state of charge reaches 10%.

Settings for these functions should be made in between the values shown.

**FUNCTION 28: FAULT COUNT POINTER (Push CONT 13)**

This register contains the location of the last stored status code recorded of the 16 stored status codes. These stored status codes have caused a PMT controller shutdown and/or disruption of normal vehicle operation.

To determine which stored status code was the last one recorded, read the number stored in Function 28. Using the Memory Map (See Section 8.1) for your logic card, match the "stored status code pointer number" (the number shown in (bold italics) in the HS (Handset) number column) on the memory map, with the number obtained from Function 28. This will be the last stored status code recorded.

**Note:** When scrolling the stored status code register, the register always starts at status code 1 and scrolls to status code 16. Instructions for scrolling the register are in Section 6.3.2 of this instruction booklet.

**FUNCTION 48: MODE 1 - CONTROLLED ACCELERATION (Push CONT 1)**

This function allows for the adjustment of the rate of time it takes for the control to accelerate to 96% applied battery voltage to the motor on hard acceleration.

<table>
<thead>
<tr>
<th>Range</th>
<th>0.1 to 22.0 seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setting</td>
<td>0 to 255</td>
</tr>
<tr>
<td>Resolution</td>
<td>0.084 seconds per set unit</td>
</tr>
</tbody>
</table>

Example: Setting of 20 = 1.8 seconds C/A

**FUNCTION 49: MODE 1 – LIFT 1 SPEED LIMIT (SL2) (Push CONT 2)**

**Note:** The following functions have function numbers larger than the numbers on the Handset keyboard. To access these functions, push the CONT key and the number shown in the following instructions at the same time. THE KEY SWITCH MUST BE OPEN.
This function allows for the adjustment of the speed limit (maximum battery volts to the motor) when the SL2 limit switch input signal is received by the control card. SL2 limit switch is a normally open switch connected to battery negative, the switch closing enables speed limit.

Range 0% to 100% battery volts
Setting 0 to 255
Resolution 0.375 volts per set unit

Example: Setting of 50 = 18.75 volts

FUNCTION 50 MODE 1 – TILT SPEED LIMIT (SL3) (Push CONT 3)

This function allows for the adjustment of the speed limit (maximum battery volts to the motor) when the SL3 limit switch input signal is received by the control card. SL3 limit switch is a normally open switch connected to battery negative, the switch closing enables speed limit.

Range 0% to 100% battery volts
Setting 0 to 255
Resolution 0.375 volts per set unit

Example: Setting of 50 = 18.75 volts

FUNCTION 51 MODE 1 – LIFT 2 SPEED LIMIT (SL4) (Push CONT 2)

This function allows for the adjustment of the speed limit (maximum battery volts to the motor) when the SL4 limit switch input signal is received by the control card. SL4 limit switch is a normally open switch connected to battery negative, the switch closing enables speed limit.

Range 0% to 100% battery volts
Setting 0 to 255
Resolution 0.375 volts per set unit

Example: Setting of 50 = 18.75 volts

FUNCTION 52: MODE 2 - CONTROLLED ACCELERATION (Push CONT 5)

Same as function 48.

FUNCTION 53: MODE 2 – LIFT 1 SPEED LIMIT (SL2) (Push CONT 6)

Same as Function 49.

FUNCTION 54 MODE 2 – TILT SPEED LIMIT (SL3) (Push CONT 7)

Same as Function 50.

FUNCTION 55 MODE 2 – LIFT 2 SPEED LIMIT (SL4) (Push CONT 8)

Same as Function 51.

FUNCTION 56 MODE 3 - CONTROLLED ACCELERATION (Push CONT 9)

Same as function 48.

FUNCTION 57 MODE 3 – LIFT 1 SPEED LIMIT (SL2) (Push CONT 10)

Same as Function 49.

FUNCTION 58 MODE 3 – TILT SPEED LIMIT (SL3) (Push CONT 11)

Same as Function 50.

FUNCTION 59 MODE 3 – LIFT 2 SPEED LIMIT (SL4) (Push CONT 12)

Same as Function 51.

FUNCTION 60 MODE 4 - CONTROLLED ACCELERATION (Push CONT 13)

Same as function 48.

FUNCTION 61 MODE 4 – LIFT 1SPEED LIMIT (SL2) (Push CONT 14)

Same as Function 49.

FUNCTION 62 MODE 4 – TILT SPEED LIMIT 3 (SL3) (Push CONT 15)

Same as Function 50.

FUNCTION 63 MODE 4 – LIFT 2 SPEED LIMIT (SL4) (Push CONT 16)

Same as Function 51.
Section 7. DASH DISPLAYS

Section 7.1 Application

The SX family Standard and Interactive Dash Displays allow the operator and maintenance personnel easy access to truck operation information and real-time system diagnostics of the controller, motor and various accessories. Hourmeter readings, battery discharge information, maintenance information and system status codes are clearly displayed during startup and running modes. Shielded cable connections are made to the Dash Display by means of five (5) 22-gage wires to the “Y” Plug of the traction and hydraulic pump controls.

Section 7.2 Standard Dash Displays

The GE Standard Dash Display is a four segment Light Emitting Diode (LED) instrument that displays the GE LX, ZX, and SX Status Codes, Hourmeter Readings, Battery Discharge Indication, and Maintenance Required Code. The four LED’s above the symbols indicate the active readout mode.

Section 7.3 Interactive Custom Dash Displays

The Interactive Custom Dash Display allows the operator to select the best vehicle performance for changing factory (task) conditions. There are four (4) “operator interaction modes” that can be selected by depressing a push-button on the dash display.

From the Dash Display, the operator may select any of four pre-set interactive modes consisting of (4) Controlled Acceleration levels, (4) Auto Regen levels and (4) Speed Limit levels.

These interactive modes are “pre-set” using the Handset (Functions 48 - 63) or a personal computer (Functions 97 - 112). This feature allows the operator to select the best vehicle performance for changing factory (task) conditions.

The Custom Dash Display incorporates all the features and functions of the Standard Dash Display, in addition to the following customer options:

- LED graphics to display Battery Discharge Indication status.
- Various LED indicators for Maintenance Required Status Codes. These can include options for traction, pump and power steer motors, hourmeter, over-temperature, seat belt, brake and other safety sensors.
- A push-button associated with the four segment LED that displays Status Codes can be used to scroll the last 16 “Stored Status Codes” that shut down vehicle operation with a PMT fault.

Connections

Connections are made to the Dash Display with five (5) 22-gage wires to Plug “Y” of each control. Shielded cable is required to eliminate signal interference.

Section 7.5 Outline Drawings

- Diagram of display with BDI and hourmeters labeled.
- Dimensions: 3.20 (81.3) and 0.41 (10.4)
- Wiring connections to "Y" plugs of Traction & Pump controls.
SECTION 7.0 AUTOCALIBRATION OF ACCELERATOR POTENTIOMETERS

When calibrating the accelerator pot, program Function 6 with a handset to a value between 15 and 20, and then exit programming mode. Cycle the key switch on and off to store the function setting, and leave the handset plugged in.

When returning the key switch to the “ON” position, make sure that the forward, reverse and start switches are open, and that the seat switch is closed. If one of these conditions is not met, an “-83” status code will appear the dash display. Once all of the above conditions have been met, four “A”‘s will appear on the handset.

AAAA

When the four “A”‘s are displayed, close the forward directional switch, with the accelerator pedal fully released. The dash display should show three “A”‘s:

AAA

Return the forward switch to the open position, and the dash display should show two “A”‘s:

AA

Fully depress the accelerator pedal and close the forward switch. Only one “A” should be displayed:

A

Re-open the forward switch. The truck will either return to a normal operating state or an “-86” status code will appear on the handset. If the “-86” code appears, either the full accelerator pedal voltage was greater than 4.5 volts, or the voltage span from no pedal depression to full pedal depression was less than 2.6 volts. Either condition requires external adjustment to the accelerator pot prior to repeating the process above.

The auto-calibration routine is now completed.
### Section 9.1 Traction Control
